Card column reference

All **711** columns across the five cards, grouped by card and then by block, with blocks ordered by **measured importance**. Each entry leads with what the column *is*; the caveats fold underneath.

Generated 2026-08-20 by `analyses/ops/gen_column_reference.py` from `card_glossary.tsv` and `card_registry.tsv`. **Do not hand-edit.**

Vintage mix â€” read before quoting a fitted column

The delivered edge card is **16 days newer** than the base it layers over. Its **84 base-owned columns** (`coupling_`, `beta_`, `dose_`, `share_`, `rank_`) carry the older vintage; the other 102 are current.

The one rule behind this layout

The rung is a property of (CARD, COLUMN) â€” never of the column name. `beta` is edge-rung on the edge card and family-rung on the gene_family card: same estimator, different unit. That is why this is organised card-first, and why one name can appear twice with different text.

How blocks are ordered

By three measured signals, not by size: how often a block's columns are named in the **discovery registry** (what the findings rest on, weighted highest), how many **modules** read them, and whether the block is **base-owned** (fitted) rather than an annotation join. Names under 6 characters count only backtick-quoted registry hits â€” otherwise `n` and `z` match ordinary prose.

One correction the measurement needed: mention-frequency is not importance â€” a *settled* block gets discussed less precisely because nobody argues about it. `adm_` scored 27th of 44 on the raw signals while MH-216 calls `adm_has_site` the single most load-bearing conditioning variable, on 4 registry mentions. Five blocks therefore carry a **curated floor**, each citing the finding that justifies it (see `CURATED_FLOOR`). That is the only hand-set input here.

Cards

- `edge â€” 186 columns, 47 blocks`
- `gene â€” 135 columns, 29 blocks`
- `gene_family â€” 61 columns, 12 blocks`
- `arm â€” 296 columns, 44 blocks`
- `seed_family â€” 33 columns, 2 blocks`

realization/edge_card.tsv

edge

One row per one (miRNA arm, gene) pair. The widest card and the one most claims are made from. 84 of its columns come from the BASE card and 102 from the annotation layer â€" check the vintage banner before quoting a fitted one.

186 columns **5,649** rows **47** blocks median coverage **72%**

Contents â€" 47 blocks, most important first

2× identifier Â· 2× real â‰¥ 0 Â· 1× boolean Â· 1× real, signed

arm
KEY IDENTIFIER 100%

KEY â€" mature miRNA arm (e.g. hsa-miR-21-5p). Normalised through `_arm_key()`, which gates against the canonical universe and LOGS drops rather than silently dropping. AUTHORED

beta
EDGE REAL â‰¥ 0 100%

EDGE-rung coupling coefficient â€" `readouts.run(level='arm')`, the same-seed collapse REMOVED. AUTHORED

gene
KEY IDENTIFIER 100%

KEY â€" HGNC gene symbol. AUTHORED

`identified`
EDGE · BOOLEAN · 100%

`|z| > 2` on the UNCALIBRATED posterior SD, where `z = beta / beta_sd` (MH-83 records precision 0.86 / recall 0.89 against a held-out standard). **True on 24.8% of edges.** AUTHORED

`identity`
EDGE · REAL, SIGNED · 96%

Shapley/LMG share of the gene's R^2 credited to this edge, with bagged-NNLS weights. AUTHORED

`z`
EDGE · REAL â‰¥ 0 · 100%

`beta / beta_sd` for the EDGE-level fit (`readouts.run(level='arm')` , the whole gene's arms as separate predictors), on the UNCALIBRATED posterior SD. AUTHORED

COUPLING_ Â· 13

core â€” the columns findings rest on

> Partial-Spearman coupling of arm dose against target mRNA in one state, conditioned on C (composition + target CN + proliferation), with its p and z.
>
> **13** columns Â· coverage **3%â€“100%** (median 62%) Â· **9** share the block description
> 5× signed âˆ’1â€¦1 Â· 5× p-value Â· 3× real, signed

`coupling_fam`
FAMILY · SIGNED âˆ’1â€¦1 · 100%

Family-level coupling for the edge's (gene, seed_family) cell. AUTHORED

`coupling_hly`
EDGE · SIGNED âˆ’1â€¦1 · 56%

in the GTEx-healthy state DERIVED

> *Defined on: arms with a GTEx-HEALTHY leg (the thinnest state â€” many arms are multi-mapping-collapsed, MH-166)*

`coupling_hly_surrogate`
EDGE · SIGNED âˆ’1â€¦1 · 3%

Healthy coupling via a same-seed SURROGATE arm, used where the arm itself has no GTEx signal. AUTHORED

`coupling_nat`
EDGE · SIGNED âˆ’1â€¦1 · 62%

in matched normal (NAT) DERIVED

> *Defined on: edges with a matched NAT leg (n~104 paired participants)*

arm_credit_share
ARM-IN-FAMILY | FRACTION 0â€“1 | 20%

This arm's share of its (gene, seed_family) cell's credit. âœ… Verified to sum to 1.0000 within every one of the 467 multi-arm cells, and it genuinely varies PER ARM inside the cell (467/467). AUTHORED

> *Defined on: multi-arm cells only (n_arm_in_cell > 1) â€” 20.3% of edges*

---

arm_dbeta
FAMILY | REAL â‰¥ 0 | 20%

maxâˆ’min Î² across the cell's member arms. AUTHORED

---

arm_detection
ARM | FRACTION 0â€“1 | 95%

Fraction of patients in which this ARM is measured at all (`readouts._detection`). AUTHORED

---

arm_id_status
ARM-IN-FAMILY | CATEGORICAL | 100%

How the arm's identity within its cell was resolved: `resolved_by_dose` 2,344 Â· `singleton` 2,260 Â· `unvalidated_balanced` 1,045. AUTHORED

---

arm_iqr
ARM | REAL â‰¥ 0 | 69%

Interquartile range of the arm's abundance â€” its DYNAMIC RANGE. AUTHORED

---

arm_lfc_HLY_NAT_raw
ARM | REAL, SIGNED | 63%

log-FC GTEx-healthy â†’ TCGA-NAT, raw. AUTHORED

---

arm_lfc_HLY_TUM_QN
ARM | REAL, SIGNED | 64%

log-FC GTEx-healthy â†’ TCGA-tumour, on quantile-normalised values. AUTHORED

---

arm_lfc_HLY_TUM_raw
ARM | REAL, SIGNED | 63%

As `arm_lfc_HLY_TUM_QN` but against the RAW GTEx median. AUTHORED

---

arm_lfc_NAT_TUM
ARM | REAL, SIGNED | 68%

log-FC of the arm's median abundance, matched NAT â†’ tumour. AUTHORED

---

arm_med_rpm
ARM | REAL â‰¥ 0 | 69%

Median linear RPM of this ARM across the cohort. Arm-rung, so it REPEATS across the arm's genes. Fill 0.686 â€” the gap is arms with no expression record, not zeros. AUTHORED

> *Defined on: edges present in the progression panel (arm expressed + state measured)*

`arm_pct_above_floor`
ARM | PERCENT | 69%

Percent of samples in which the arm sits above the detection floor (median 99). Feeds `arm_spiker` together with `arm_iqr`. AUTHORED

> *Defined on: edges present in the progression panel (arm expressed + state measured)*

`arm_role_in_family`
ARM-IN-FAMILY | CATEGORICAL | 72%

â›” **The ARM's DOSE role inside its seed family â€" NOT the family's role in the gene**, which is what the name suggests. AUTHORED

`arm_sep_z`
FAMILY | REAL Â‰¥ 0 | 20%

`arm_dbeta` in units of the cell's own pooled posterior SD â€" can these same-seed arms be told apart at all. AUTHORED

`arm_share_of_family_dose`
ARM-IN-FAMILY | FRACTION 0â€"1 | 69%

The arm's share of its seed family's TOTAL dose â€" denominator is the **full family**, not the design (median 0.69). The quantity `family_role` is cut from. AUTHORED

> *Defined on: edges present in the progression panel (arm expressed + state measured)*

`arm_spiker`
ARM | BOOLEAN | 69%

`arm_pct_floor < 40 AND arm_iqr > 1.5` â€" the arm sits at/below the detection floor in most samples yet swings widely when present. AUTHORED

ADM_ Â· 4

core â€" the columns findings rest on

---

4 columns Â· coverage **87%â€"87%** (median 87%)
4× boolean

`adm_admissible`
EDGE | BOOLEAN | 87%

The admissibility verdict: site + evidence + expression. AUTHORED

`adm_expr_gtex`
EDGE | BOOLEAN | 87%

ADMISSIBILITY â€" could this edge repress in breast AT ALL? `has_site` (seed match in the 3'UTR) AND `expressed` (arm present in TCGA tumour OR GTEx healthy breast). AUTHORED

`adm_expr_tcga`
EDGE | BOOLEAN | 87%

Is the arm expressed above floor in TCGA? AUTHORED

`adm_has_site`
EDGE | BOOLEAN | 87%

Does the arm have a seed match in this target's 3'UTR. AUTHORED

BETA_ Â· 8

core â€" the columns findings rest on

---

8 columns Â· coverage **20%â€"100%** (median 100%)
4× real â‰¥ 0 Â· 4× fraction 0â€"1

`beta_arm`
EDGE | REAL Â‰¥ 0 | 20%

The arm's OWN Î² from the within-cell fit (`arm_rung.py`), defined only in multi-arm cells (fill 0.203). AUTHORED

`beta_deconv`
EDGE | REAL Â‰¥ 0 | 100%

Î² refit on the DECONV design (core C + the 8 non-malignant Wu-major lineages, Cancer-Epithelial held out). AUTHORED

`beta_frac`
EDGE | FRACTION 0Â€"1 | 100%

MAGNITUDE share (beta_f / sum beta). AUTHORED

`beta_frac_abs`
EDGE | FRACTION 0Â€"1 | 100%

|E[Î²_f]| / Î£|E[Î²]| â€" the share computed from the POINT ESTIMATES. AUTHORED

---

beta_frac_deconv
EDGE · FRACTION 0â€“1 · 100%

`beta_frac` recomputed on the deconv design â€” the composition-adjusted share of the gene's budget. AUTHORED

beta_frac_sd
EDGE · FRACTION 0â€“1 · 100%

Posterior SD of the per-draw fraction Î²_f/Î£Î². AUTHORED

beta_sd
EDGE · REAL â‰¥ 0 · 100%

Posterior summaries of the coupling coefficient from the dense Gibbs fit (`learned/readouts.py`). `_sd` is the posterior SD, `_frac` the share of the gene's total beta. AUTHORED

beta_sd_deconv
EDGE · REAL â‰¥ 0 · 100%

Posterior SD on the deconv design. AUTHORED

N_ Â· 5

core â€” the columns findings rest on

> **5** columns Â· coverage **20%â€“100%** (median 100%)
> 4× count Â· 1× constant

n_HLY_meas
EDGE · COUNT · 72%

How many of this gene's arms have a MEASURED healthy (GTEx) level â€” as opposed to one manufactured by the multi-mapping collapse. AUTHORED

n_arm_in_cell
FAMILY · COUNT · 20%

How many arms sit in this edge's (gene, seed_family) CELL â€” i.e. how many of that family's members appear in THIS gene's design. AUTHORED

n_fam
GENE · COUNT · 100%

How many families compete at this edge's GENE. Gene-rung â€” it repeats across the gene's edges by construction. beta is mathematically inert where it is 1. AUTHORED

n_family_in_design
FAMILY · COUNT · 100%

Members of this arm's seed family **THAT ARE IN THIS GENE'S DESIGN** â€” 1 on **4,497 of 5,644 edges (79.7%)**. AUTHORED

n_samples
GENE · CONSTANT · 100%

Samples the edge was fit on â€” CONSTANT (1,040) across the card. AUTHORED

SHARE_ Â· 4

core â€” the columns findings rest on

> The arm's share of the gene's total regulatory dose in one state (HLY / NAT / TUM). Within-gene, sums to 1 across the gene's arms.
> **4** columns Â· coverage **46%â€“72%** (median 72%) Â· **2** share the block description
> 4× fraction 0â€“1

share_HLY
EDGE · FRACTION 0â€“1 · 72%

The arm's share of the gene's healthy (GTEx) pressure budget, median **0.129**. AUTHORED

share_HLY_meas
EDGE · FRACTION 0â€“1 · 46%

`share_HLY` over ONLY the arms GTEx genuinely measures â€” invisible arms ABSTAIN (NaN) instead of being zeroed (MH-210). Median **0.244** against the imputed 0.129. AUTHORED

share_NAT
EDGE · FRACTION 0â€“1 · 72%

in matched normal (NAT) DERIVED

> *Defined on: edges with a matched NAT leg (n~104 paired participants)*

share_TUM
EDGE · FRACTION 0â€“1 · 72%

in tumour DERIVED

Î² Â· standard deviation DERIVED

cal_beta_sd_lo
EDGE REAL â‰¥ 0 100%

Î² Â· standard deviation DERIVED

cal_identified
EDGE BOOLEAN 100%

Is the edge identified (`|cal_z| > 2`) under the CALIBRATED posterior width â€” the honest version of `identified`: **1,110 vs 1,375 edges**, i.e. **19.9% [18.1â€“22.4]** against 24.8%. AUTHORED

cal_identified_hi
EDGE BOOLEAN 100%

The UPPER end of the calibrated identification band â€” `|cal_z| > 2` under the optimistic calibration (990 edges vs 1,110 central). AUTHORED

cal_identified_lo
EDGE BOOLEAN 100%

The LOWER end of the calibrated identification band (1,234 edges vs 1,110 central). See `cal_identified_hi` â€” the pair is the uncertainty, and reporting one alone hides it. AUTHORED

cal_z
EDGE REAL â‰¥ 0 100%

z-score DERIVED

ECHIM_ Â· 3

core â€” the columns findings rest on

3 columns Â· coverage **8%â€“26%** (median 22%)
2× count Â· 1× real â‰¥ 0

echim_manakov_w
EDGE REAL â‰¥ 0 22%

Manakov chimeric-eCLIP support weight for this edge (median 3, max 1,712). AUTHORED

echim_n_sources
EDGE COUNT 26%

How many chimeric-eCLIP sources support this edge (1 on 1,151 Â· 2 on 262 Â· 3 on 34). AUTHORED

echim_tarbase_w
EDGE COUNT 8%

TarBase chimeric support weight (median 2, max 28) â€" a much shorter tail than the Manakov twin, and defined on only 8.4% of edges. AUTHORED

> *Defined on: edges with a chimeric (AGO-ligation) duplex â€" âš per-source, NEVER pooled; cross-tissue, not breast*

RANK_ Â· 4

core â€" the columns findings rest on

d_rank_NAT_TUM
EDGE | REAL, SIGNED | 72%

rank Â· in matched normal (NAT) Â· in tumour DERIVED

> *Defined on: edges with a matched NAT leg (n~104 paired participants)*

GENE_ Â· 6

supporting â€” read these when the core raises a question

> Gene-level properties carried onto this row (its regulator count, repression class, net-repression flag). On the edge card these REPEAT within gene by construction.
>
> **6** columns Â· coverage **72%â€“100%** (median 99%) Â· **3** share the block description
> 2× categorical Â· 2× boolean Â· 1× real â‰¥ 0 Â· 1× real, signed

gene_cancer_role
GENE | CATEGORICAL | 100%

â›” **NOT the arm's role â€” the GENE's cancer role** (`oncogene` / `tsg` / `oncogene/tsg` / `unknown`), from `gene_roles.load_gene_roles`. AUTHORED

gene_dominated
GENE | BOOLEAN | 97%

Does one family carry **more than 60%** of this gene's tumour pressure budget (2,641 of 5,495)? AUTHORED

gene_iqr
GENE | REAL Â‰¥ 0 | 72%

interquartile range DERIVED

> *Defined on: genes with a NAT-TUM gene-level leg*

gene_lfc_NAT_TUM
GENE | REAL, SIGNED | 72%

in matched normal (NAT) Â· in tumour DERIVED

> *Defined on: genes with a NAT-TUM gene-level leg*

gene_net_repr
GENE | BOOLEAN | 100%

Is this gene NET-REPRESSED in tumour by the Â§6b-RETIRED heuristic lane (1,376 of 5,634 edges)? AUTHORED

gene_repr_class
GENE | CATEGORICAL | 100%

class label DERIVED

AGO_ Â· 2

supporting â€” read these when the core raises a question

> **2** columns Â· coverage **95%â€“100%** (median 97%)
> 1× fraction 0â€“1 Â· 1× boolean

ago_loading
ARM | FRACTION 0Â€“1 | 95%

AGO/RISC loading discount. AUTHORED

ago_loading_measured
ARM | BOOLEAN | 100%

Was `ago_loading` actually MEASURED for this edge (vs defaulted to 1.0). True for 3,820/5,648 edges (67.6%). AUTHORED

> *Defined on: arms with a Manakov AGO-dominance measurement â€” â›” NOT loading(), which fabricates 1.0*

PIP_ Â· 2

supporting â€” read these when the core raises a question

> **2** columns Â· coverage **100%â€“100%** (median 100%)
> 1× constant Â· 1× fraction 0â€“1

pip_dense
EDGE | CONSTANT | 100%

âš CONSTANT by construction â€” the coupling readout is called with Ï€â‰¡1, so every edge has the same value. AUTHORED

pip_discovery
EDGE | FRACTION 0Â€“1 | 100%

Posterior inclusion probability. `pip_dense` comes from the pi=1 coupling readout; `pip_discovery` from the evidence-pi readout. AUTHORED

RETENTION_ Â· 3

reference â€” context, provenance and rarely-quoted detail

> **3** columns Â· coverage **72%â€“100%** (median 100%)
> 1× real â‰¥ 0 Â· 1× boolean Â· 1× real, signed

retention_beta
EDGE | REAL Â‰¥ 0 | 100%

Fraction of an effect surviving covariate adjustment (adjusted / raw). AUTHORED

retention_reliable
EDGE | BOOLEAN | 100%

Is this edge's `retention` ratio trustworthy â€” i.e. does it have a real denominator? AUTHORED

retention_rho
EDGE | REAL, SIGNED | 72%

Ï_deconv / Ï_core â€” AUTHORED

OOF_ Â· 3

reference â€” context, provenance and rarely-quoted detail

> Out-of-fold predictive correlation, arm-level vs family-level, and their difference (`oof_drho` = arm minus family). Negative = the arm-resolved fit predicts repression better.
>
> **3** columns Â· coverage **20%â€“20%** (median 20%) Â· **2** share the block description
> 3× signed âˆ’1â€¦1

oof_drho
FAMILY | SIGNED Âˆ’1Â€¦1 | 20%

Arm-level OOF rho MINUS family-level. AUTHORED

oof_rho_arm
FAMILY | SIGNED Âˆ’1Â€¦1 | 20%

Spearman Ï Â· per arm DERIVED

> *Defined on: multi-arm cells only (n_arm_in_cell > 1) â€” 20.3% of edges*

oof_rho_fam
FAMILY · SIGNED Â^'1Â€¦1 · 20%

Spearman Ï Â· per seed family DERIVED

> *Defined on: multi-arm cells only (n_arm_in_cell > 1) â€” 20.3% of edges*

GRANK_ Â· 3

reference â€" context, provenance and rarely-quoted detail

> The arm's GLOBAL (cohort-wide) dose rank in one state. This is what the dominant-regulator and handoff columns are computed from.
>
> **3** columns Â· coverage **63%â€“69%** (median 68%) Â· **3** share the block description
> 3× count

grank_HLY
ARM · COUNT · 63%

in the GTEx-healthy state DERIVED

> *Defined on: arms with a GTEx-HEALTHY leg (the thinnest state â€" many arms are multi-mapping-collapsed, MH-166)*

ARM · COUNT · 69%

in tumour DERIVED

> *Defined on: edges present in the progression panel (arm expressed + state measured)*

COMPOSITION_ Â· 1

reference â€" context, provenance and rarely-quoted detail

> **1** columns Â· coverage **100%â€“100%** (median 100%)
> 1× categorical

composition_class
EDGE · CATEGORICAL · 100%

Composition-adjustment verdict for this row (e.g. `composition_explained` when the effect does not survive the deconvolution block). AUTHORED

W_ Â· 1

reference â€" context, provenance and rarely-quoted detail

> **1** columns Â· coverage **100%â€“100%** (median 100%)
> 1× real â‰¥ 0

w_max
GENE · REAL Â‰¥ 0 · 100%

Maximum curated EVIDENCE weight over the gene's regulators. Gene-rung repeat. AUTHORED

OWN_ Â· 1

reference â€" context, provenance and rarely-quoted detail

> **1** columns Â· coverage **88%â€“88%** (median 88%)
> 1× real â‰¥ 0

own_specific_frac
ARM · REAL Â‰¥ 0 · 88%

Fraction of the arm's variance that is target-specific. AUTHORED

TERM_ Â· 3

reference â€” context, provenance and rarely-quoted detail

3 columns Â· coverage **68%â€“68%** (median 68%)
2× signed â^'1â€¦1 Â· 1× real, signed

term_ABUND
EDGE | SIGNED Â^'1Â€¦1 | 68%

Decomposition of the acquisition score into ABUNDANCE, WIRING and INTERACTION terms. AUTHORED

> *Defined on: edges present in the progression panel (arm expressed + state measured)*

term_INTERACT
EDGE | SIGNED Â^'1Â€¦1 | 68%

The INTERACTION term â€" the part of the NATâ†'tumour change attributable to abundance and wiring moving TOGETHER. AUTHORED

term_WIRING
EDGE | REAL, SIGNED | 68%

The WIRING term of the dose-vs-wiring decomposition: how much of the NATâ†'tumour change comes from the arm's M-weight moving rather than its abundance. AUTHORED

M_ Â· 1

reference â€” context, provenance and rarely-quoted detail

1 columns Â· coverage **100%â€“100%** (median 100%)
1× real â‰¥ 0

m_nnls
EDGE | REAL Â‰¥ 0 | 100%

Bagged-NNLS weight. Exactly 0 in 31.7% of families â€" this is what lets `identity` say a regulator contributes nothing, which `beta` structurally cannot. AUTHORED

PRIOR_ Â· 1

reference â€” context, provenance and rarely-quoted detail

1 columns Â· coverage **100%â€“100%** (median 100%)
1× constant

prior_pi
EDGE | CONSTANT | 100%

The Gibbs sampler's inclusion prior â€" **CONSTANT 0.05** across the card. AUTHORED

DGLOBAL_ Â· 3

reference â€” context, provenance and rarely-quoted detail

Change in the arm's GLOBAL (cohort-wide) dose rank between two states. HLY_NAT is the FIELD delta, NAT_TUM the malignant step.

3 columns Â· coverage **63%â€“68%** (median 63%) Â· **3** share the block description
3× real, signed

dGlobal_HLY_NAT
ARM | REAL, SIGNED | 63%

in the GTEx-healthy state Â· in matched normal (NAT) DERIVED

> *Defined on: arms with a GTEx-HEALTHY leg (the thinnest state â€" many arms are multi-mapping-collapsed, MH-166)*

> **1** columns Â· coverage **73%â€“73%** (median 73%)
> 1× signed â^'1â€¦1

edge_rho_adj
EDGE | SIGNED Â^'1Â€¦1 | 73%

An edge-rung quantity carried onto this row. AUTHORED

> *Defined on: the WITHIN-PATIENT paired subset (n=103 matched tumour/NAT pairs, MH-158)*

MEAN_ Â· 2

reference â€” context, provenance and rarely-quoted detail

> **2** columns Â· coverage **90%â€“90%** (median 90%)
> 2× real, signed

mean_dGlobalRank
ARM | REAL, SIGNED | 90%

Mean change in the arm's GLOBAL abundance percentile across the paired patients. AUTHORED

mean_own_shift
ARM | REAL, SIGNED | 90%

A per-row mean of a lower-rung quantity; check `agg_of` for which rung it summarises. AUTHORED

> *Defined on: the WITHIN-PATIENT paired subset (n=103 matched tumour/NAT pairs, MH-158)*

SURROGATE_ Â· 2

reference â€” context, provenance and rarely-quoted detail

> **2** columns Â· coverage **3%â€“3%** (median 3%)
> 1× fraction 0â€“1 Â· 1× categorical

surrogate_corr
ARM | FRACTION 0Â€“1 | 3%

How well the surrogate tracks the arm where both are observed (0.54 â€“ 0.89). AUTHORED

surrogate_instrument
ARM | CATEGORICAL | 3%

Which SURROGATE stands in for a collapsed GTEx healthy leg (7 levels; defined on 3% of edges). AUTHORED

ESUB_ Â· 8

reference â€” context, provenance and rarely-quoted detail

> PAM50 subtype-stratified coupling at the EDGE rung â€” one fit per subtype plus the pooled fit and an adjusted q.
>
> **8** columns Â· coverage **98%â€“100%** (median 99%) Â· **5** share the block description
> 6× signed â^'1â€¦1 Â· 1× categorical Â· 1× p-value

esub_best_sub
EDGE | CATEGORICAL | 100%

the best DERIVED

> *Defined on: edges with a per-PAM50 heterogeneity fit â€” âš DISTRIBUTIONAL (MH-165), not a per-edge subtype label*

esub_q_adj
EDGE | P-VALUE | 98%

BH-adjusted q for the best-subtype contrast â€” AUTHORED

esub_rho_Basal
EDGE | SIGNED Â˘'1Â€¦1 | 99%

Spearman Ï DERIVED

> *Defined on: edges with a per-PAM50 heterogeneity fit â€” âš DISTRIBUTIONAL (MH-165), not a per-edge subtype label*

esub_rho_Her2
EDGE | SIGNED Â˘'1Â€¦1 | 98%

Spearman Ï DERIVED

> *Defined on: edges with a per-PAM50 heterogeneity fit â€” âš DISTRIBUTIONAL (MH-165), not a per-edge subtype label*

esub_rho_LumA
EDGE | SIGNED Â˘'1Â€¦1 | 99%

Spearman Ï DERIVED

> *Defined on: edges with a per-PAM50 heterogeneity fit â€” âš DISTRIBUTIONAL (MH-165), not a per-edge subtype label*

esub_rho_LumB
EDGE | SIGNED Â˘'1Â€¦1 | 99%

Spearman Ï DERIVED

> *Defined on: edges with a per-PAM50 heterogeneity fit â€” âš DISTRIBUTIONAL (MH-165), not a per-edge subtype label*

esub_rho_best
EDGE | SIGNED Â˘'1Â€¦1 | 100%

Coupling in the arm's BEST PAM50 subtype. AUTHORED

esub_rho_pool
EDGE | SIGNED Â˘'1Â€¦1 | 100%

Coupling pooled across subtypes â€” the unselected reference for `esub_rho_best` (median â˘'0.0135, indistinguishable from a random-subtype draw at â˘'0.0123). AUTHORED

REALIZATION_ Â· 2

reference â€” context, provenance and rarely-quoted detail

> **2** columns Â· coverage **58%â€“69%** (median 63%)
> 1× fraction 0â€“1 Â· 1× real, signed

realization_identity
EDGE | FRACTION 0Â€“1 | 58%

Within-patient realization quantities â€” the score, its identity allocation, and who owns it. AUTHORED

> *Defined on: genes with a family-level realization fit*

realization_score
EDGE | REAL, SIGNED | 69%

`â˘'coupling_z_tum` â€” the calibrated tumour repression strength as a positive score, so bigger = more repressed. AUTHORED

KD_ Â· 2

reference â€” context, provenance and rarely-quoted detail

> **2** columns Â· coverage **85%â€“85%** (median 85%)
> 1× percent Â· 1× real, signed

kd_affinity_pct
EDGE | PERCENT | 85%

Is this gene among the arm's strongest predicted targets â€” a WITHIN-ARM percentile, **higher = stronger target**. AUTHORED

kd_repression
EDGE | REAL, SIGNED | 85%

scanMiR RBNS binding affinity. AUTHORED

WIRING_ Â· 1

reference â€” context, provenance and rarely-quoted detail

1 columns Â· coverage **68%â€“68%** (median 68%)
1× fraction 0â€“1

wiring_frac
EDGE | FRACTION 0â€“1 | 68%

Fraction of the acquisition score attributable to WIRING rather than abundance. AUTHORED

> *Defined on: edges present in the progression panel (arm expressed + state measured)*

CELL_ Â· 1

reference â€” context, provenance and rarely-quoted detail

1 columns Â· coverage **20%â€“20%** (median 20%)
1× boolean

cell_arms_resolvable
FAMILY | BOOLEAN | 20%

Are the cell's arms separable AND does splitting them help out-of-fold. True for 31.7% of edges in multi-arm cells. AUTHORED

SD_ Â· 1

reference â€” context, provenance and rarely-quoted detail

1 columns Â· coverage **20%â€“20%** (median 20%)
1× real â‰¥ 0

sd_arm
EDGE | REAL â‰¥ 0 | 20%

Posterior SD of the arm-level Î². AUTHORED

Z_ Â· 1

reference â€” context, provenance and rarely-quoted detail

1 columns Â· coverage **20%â€“20%** (median 20%)
1× real â‰¥ 0

z_arm
EDGE | REAL â‰¥ 0 | 20%

`beta_arm / sd_arm` from the WITHIN-CELL fit (`arm_rung.py`) â€” the arm's z inside its (gene, seed_family) cell only, defined on the 20.3% of edges in multi-arm cells. AUTHORED

ACQUISITION_ Â· 1

reference â€” context, provenance and rarely-quoted detail

1 columns Â· coverage **59%â€“59%** (median 59%)
1× real, signed

acquisition_score
EDGE | REAL, SIGNED | 59%

Composite acquisition score across states. AUTHORED
